

# FAST FACT: MELANOMA GENETIC TESTING OPTIONS

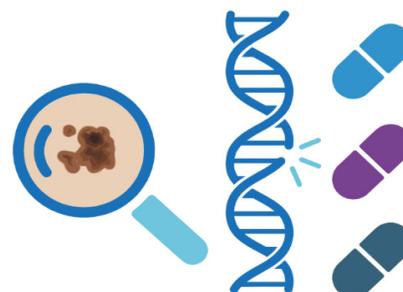

Dr Nicole Rossum

November 2025

In South Africa, melanoma is the 4th most prevalent cancer in men, and the 5th most prevalent cancer among women. Genetic testing plays an integral part in the diagnosis, prognostication, and management of melanoma.

Various testing options available at Ampath are summarised below, as well as relevant biomarkers and their matched targeted therapies

Mnemonic	Details	Genes tested	Turnaround time	Sample requirements
<b>GFISH</b>	FISH	<i>RREB1</i> (6p25), <i>MYB</i> (6q23), <i>CCND1</i> (11q13)	4 working days	Formalin Fixed Paraffin Embedded Tissue (FFPE) 4 normal slides (not charged) with 10 micron thick unstained recuts
<b>BRAF</b>	<i>BRAF</i> PCR	<i>BRAF</i> V600 E/E2/D/D2/K/R	4 working days	
<b>EGFRASSEQ</b>	DNA only NGS panel (no fusions)	<i>BRAF</i> , <i>CDKN2A</i> , <i>CTNNB1</i> , <i>GNA11</i> , <i>GNAQ</i> , <i>KIT</i> , <i>NRAS</i> , <i>PIK3CA</i> , <i>PTEN</i> , <i>TP53</i>	10 working days	Formalin Fixed Paraffin Embedded Tissue (FFPE) 8-12 normal slides (not charged) with 10 micron thick unstained recuts
<b>OCASUB</b>	DNA and RNA panel	<i>AKT3</i> , <i>ALK</i> , <i>ARID2</i> , <i>BAP1</i> , <i>BRAF</i> , <i>CCND1</i> , <i>CDKN2A</i> , <i>CDK4</i> , <i>CYSLTR2</i> , <i>EIF1AX</i> , <i>ERBB4</i> , <i>EZH2</i> , <i>HRAS</i> , <i>GNAQ</i> , <i>GNA11</i> , <i>GRIN2A</i> , <i>KIT</i> , <i>KRAS</i> , <i>MAP2K1</i> , <i>MDM2</i> , <i>MET</i> , <i>MITF</i> , <i>MPA3KA</i> , <i>NF1</i> , <i>NRAS</i> , <i>NTRK</i> , <i>PIK3CA</i> , <i>PLCB4</i> , <i>PPP6C</i> , <i>PRKAR1A</i> , <i>PTEN</i> , <i>RAC1</i> , <i>RET</i> , <i>ROS1</i> , <i>RB1</i> , <i>SF3B1</i> , <i>TERT</i> , <i>TP53</i> , <i>TYR</i>	14 working days	10 micron thick unstained recuts or 10 micron thick recuts in an Eppendorf tube or Paraffin Embedded tissue block
<b>TMB</b>	Tumour mutational burden measurement	90 genes	14 working days	

Biomarker	Therapeutic Implications
<b>BRAF V600E</b>	<i>BRAF</i> /MEK inhibitors (e.g. dabrafenib-trametinib)
<b>BRAF non V600E</b>	Mutations in codons near V600 have shown response to MEK inhibitors and <i>BRAF</i> and MEK inhibitor combinations
<b>BRAF fusions</b>	Fusions in <i>BRAF</i> have also shown responses to MEK inhibitors and nonspecific <i>RAF</i> inhibitors (e.g. sorafenib)
<b>BRAF amplification</b>	Resistance to <i>BRAF</i> inhibitors
<b>KIT</b>	<ul style="list-style-type: none"> <li>- Exon 11 and 13 mutations are associated with sensitivity to <i>KIT</i> inhibitors</li> <li>- D816H mutation is associated with resistance to <i>KIT</i> inhibitors</li> <li>- <i>KIT</i> amplifications appear to have minimal or no sensitivity to <i>KIT</i> inhibitors</li> </ul>
<b>NRAS</b>	May be associated with response to MEK inhibitors in some patients
<b>KRAS</b>	May be associated with response to MEK inhibitors in some patients
<b>PTEN</b>	Associated with resistance to targeted and immunotherapy
<b>NF1</b>	Potential therapeutic target - novel <i>NF1</i> binding partner: Calpain1 ( <i>CAPN1</i> )
<b>ALK</b>	Fusion-directed therapy (e.g. crizotinib)
<b>ROS1</b>	Fusion-directed therapy (e.g. crizotinib or entrectinib)
<b>NTRK 1/2/3</b>	Fusion-directed therapy (e.g. larotrectinib or entrectinib)
